Complete page index and source reconciliation

704-page official packet · Verified bytes · 14 November 2026 UTC

Every physical PDF page is accounted for. The index assigns 616 pages to identified units and explicitly preserves 88 leaves with unknown identity or relationship. Redaction prevents complete reconstruction of the underlying document set. The arithmetic corrections do not supply evidence of foreknowledge or overturn the documented SEC/FBI no-evidence conclusion.

Physical pages	Identified pages	Explicit unknowns	Omitted pages
704	616	88	0

Exact official source

Provenance: official-get.json contains request/response headers, UTC timestamps and byte hash; pdf_metadata.json retains metadata/XMP. The complete original PDF is included unchanged in the audit bundle. Official landing page: SEC records provided to the 9/11 Commission.

Coverage and how to read the index

The JSON contains **704 unique page records**, **170 primary index units** and **two embedded texts**. Units include documents, attachments, dividers and separately titled report sections; this count is not a claim that 172 distinct original documents can be recovered. Each page has a stable ID, source URL with a page locator, visible pagination/Bates, markings, uncertainty, OCR locator and render/OCR hashes.

Unknown class	Pages retained explicitly
73 redacted leaves	460–467, 469–478, 486–495, 566, 574–575, 596–598, 612–620, 624–653.
10 blank leaves	375, 377, 395, 397, 412, 426, 428, 430, 468, 518. Some retain fax/reproduction marks.
5 unresolved dividers	530, 563, 567, 570, 572. Their visible character is recorded; a parent is not invented.

Boundaries follow the visible pages

The **pdf_pages** list is authoritative. Start/end are only envelopes when documents are non-contiguous. Examples include the German MOU interrupted by other material and resumed in reverse order (396,398–408,415–418), and the Québec letter on 534/538 surrounding its name-list attachment on 535–537. The Master List (54–240), NASD Travelocity section (352–357) and August statement (519–529) were joined across review ranges only after visual confirmation.

Bates text is not extrapolated. PDF 372 visibly reads **RFBI 03003674**, while the bookmark says RSEC03003674. PDF 455's handwriting reads **RSEC 0301727**, while the bookmark says RSEC03010727. Uncertain or overwritten identifiers remain qualified. A bookmark is metadata, not a visible page stamp.

Appendix lettering is also preserved: the contents at PDF 21 list databases as D, while PDF 25 actually says **Appendix C: Databases Created**. Repeated full-redaction images are flagged as identical renders, without claiming that the hidden originals are duplicates.

Inspection and limits

All pages were rendered at 200 dpi and visually reviewed. OCR supported navigation; difficult identifiers and reconciliation passages were enlarged or oriented. Dense transaction tables were inspected for identity, extent and relevant evidence, not re-keyed as certified trade data. Exact legible markings are retained; page-level notes identify limits on repeated small-label typography. Redacted identities are not reconstructed.

Tools: Python 3.12.14 urllib/hashlib; PyMuPDF 1.26.6; pypdf 6.21.4; pdfinfo 26.05.0; pdftotext 25.03.0; Tesseract 5.5.0 (English, psm3); Pillow 13.0.0. Report: ReportLab 4.4.9. Final structural validation checks page uniqueness, assignments, non-contiguous membership, CSV agreement, hashes and source integrity.

Volume corrections and newsletter arithmetic

Canceled 500: aggregate corrected, allocation unproved

Observed: the original memo prints 2,075 UAL puts for September 6. The May 2004 fax includes an OCC page with 3,150 put contract-sides and a Market Watch page with a circled **CXL 500**. **Arithmetic:** 3,150 ÷ 2 = **1,575**, matching 2,075 − 500. The eight buy quantities in the **642 C clearing-firm/customer-class block** total 2,000; removing the marked row leaves 1,500 in that block.

Limit: this is not a beneficial-account allocation ledger. It does not establish that a particular adviser client held the canceled 500 or all remaining 1,500. The marked row carries B/O; the follow-up calls the canceled transaction a sale. A counterparty/perspective match is not established. The 2004 summary attributes the explanation to Cella and Ribelin: a recorded witness account, not sworn testimony or a native audit trail. The old 2,000/96% adviser narrative must not be recalculated against 1,575 without a verified numerator.

SEC PDF 9 and 696–698 — memo opens RSEC 03003652 at 2; fax cover RSEC 04019095 at 696; no Bates asserted on 697–699. Cella follow-up PDF 21–22 — MFR04019347 at 21; provenance caveat on page 6.

Use the convention printed on these OCC reports

Reported inputs	Derived contracts	Remaining issue
UAL puts: 3,150 sides	1,575	Corrects the original 2,075 aggregate.
UAL calls: 70 UAL + 40 LUA + 14 VUA = 124 sides	62 across those roots; 35 UAL alone	Original memo’s 87 remains unexplained. LUA/VUA are annotated LEAP.
AMR puts: 4,516 AMR + 40 VMR = 4,556 sides	2,278; VMR contributes 20	Four below original 2,282; VMR is annotated LEAP.
AMR calls: 748 sides	374	Handwritten annotation says 375.

SEC PDF 697 and 699; the same sides÷2 instruction appears on BA query pages 577–586. This is a convention of these specific historical reports, not every OCC series. Aggregate volume is not necessarily opening purchases.

Newsletter: preserve the printed discrepancy

PDF 10 gives 388 contracts plus 365, but prints 763. **388 + 365 = 753**, a ten-contract discrepancy. It says 28 purchasers were interviewed and 26 cited the newsletter; “They” is ambiguous as the antecedent for 388. The additional 27 are identified as subscribers, which does not itself prove their purchase motive. No visible purchaser schedule resolves the error. The quoted recommendation and reported distribution do not establish receipt or reliance by every buyer.

SEC PDF 10–11; printed 9–10 — memo opening RSEC 03003652 at 2.

Accounts, copied-row hypothesis and databases

Portfolio context does not establish account allocation

The SEC memo describes a U.S. adviser managing several hedge funds with $5.3 billion. It says staff interviewed the CEO/trader and reviewed account statements; the FBI also interviewed them. The reported airline strategy includes September 6 shorts of 1,800 AMR, 8,700 Continental and 18,500 Delta shares; later shorts of 3,800 Delta and 500 Northwest; and September 10 purchases of 115,000 AMR shares alongside 117,000 UAL shares sold short.

These are agency summaries of interviews and records. They do not show that every position belonged to one beneficial account. No visible identifier bridge ties the redacted managed-account forms/statements to the principal adviser, the canceled 500 or the separate loss example. Different issuers' share counts cannot be treated as a portfolio offset; prices, allocations and complete positions are missing.

SEC PDF 9–10; printed 8–9 — RSEC 03003652 at memo opening 2.

The $85,000 loss belongs to a distinct reported example

The official Commission staff monograph describes a **September 7** New York hedge fund with **$2 billion** under management, UAL puts, short UAL calls and **29,000 UAL shares**, and reports an $85,000 decline in value when markets reopened. Its date, fund size and positions distinguish it from the September 6 $5.3 billion adviser example. This is a reported staff finding, not replicated P&L.

Commission monograph PDF 151–152; printed 148–149 — no visible Bates; separate source, not part of the 704-page count.

September 5/7 copying remains a hypothesis

The original UAL rows are **111 calls / 605 puts** on September 5 and **111 / 606** on September 7. They are not literal duplicates. The May 2004 memo records the witnesses' suggestion of a copied row; neither a copy operation nor a corrected replacement row is demonstrated.

SEC PDF 9; printed 8; Cella follow-up PDF 21 — MFR04019347.

MaST, the disc image and NYSE Master List are distinct evidence

PDF 25 describes SEC **MaST**; PDF 449 says a CD containing MaST was delivered; PDF 623 depicts a disc labelled **MASTS / REQUEST #2 / RSEC03010731**. The **NYSE Master List** is the printed Exhibit E at 54–240. NASD's promised February 2002 CD and Cella's description of SEC data supplied to DOJ/Seisint are separate transfer accounts. No manifest, schema, checksum or identifier crosswalk equates them. The official PDF contains no embedded native files or file-attachment annotations.

SEC PDF 25,449,623 — RSEC03003652C; RSEC 03010722; RSEC03010731. SEC PDF 54–240 and 260–261 — NASD cover RSEC03003652F. Cella interview PDF 9 — MFR03010885 at 1.

Foreign referrals: what the visible originals establish

The substantive outcome and the permission to disclose a report are separate. The following distinctions preserve both the agency conclusions and gaps in the public packet. The reconciliation JSON gives the full page/Bates locator set for every row.

Jurisdiction	Observed record and permissible conclusion
Australia	ASIC/ASX emails report no evidence to date while work continues. The November 8, 2001 memo finds no direct association from supplied names, notes possible indirect associations, and requests clarification. October 24, 2003 is disclosure consent, not final case clearance. PDF 587–595,659–660; RSEC 03010730 at 587; RSEC 03012419 at 659.
Québec / Montréal	September 21: no unusual TD Waterhouse options activity; other work ongoing. December 12: completed review of all Bourse-listed futures/options markets, August 27–September 11, with no unusual activity; sent December 17. Separate name inquiries still seek identifiers. PDF 603–607,658; RSEC 03010730D at 603; RSEC 03012418 at 658.
Singapore	October 17: no unusual price/volume in nine listed U.S.-registered securities/products over August 27–September 11; further trading-record review continues. No final trader-by-trader outcome supplied. PDF 608–609; RSEC 03010730E at 608.
Switzerland	October 4: initial information and ongoing exchange/customer work. The attachment at 661–686 is a securities universe. A March 8, 2002 report is listed as reviewed at SEC offices; the index cannot substitute for its contents. PDF 599–601,661–686,704; RSEC 03010730B at 599; RSEC 03012420 at 661.
France	October 3: nothing unusual noticed except AXA among four requested listed securities. October 16 seeks AXA owners/delivery information; the SLAB table at 655 is present. These do not supply a final AXA outcome or the native 580-plus-page workbook referenced elsewhere. PDF 610–611,655,687–695; RSEC 03010730F,03011670,03012422,03012423 at the respective openings.
Hong Kong / Brazil	Hong Kong’s visible annex concerns post-attack solicitation fraud, not pre-attack trading clearance. Brazil’s visible item is a translated newspaper article about Embraer, not a regulator’s final disposition. PDF 602,621–622,702; RSEC 03010730C at 602.

No redacted account is identified from a similar name. No unresolved visible link is treated as proof of illicit trading. The full matrix also distinguishes Germany, the Netherlands, Italy, Japan and the UK on the next page.

Documented conclusion, scope and remaining limits

Foreign records: production status is not a merits outcome

PDF 702 lists German letters of December 5, 2001/April 29, 2002 and Dutch letters of January 14/17, 2002 as produced. It does not reveal their transaction-level findings. The May 2002 SEC memo separately reports German officials' statement that their inquiry had found no unusual trading. November 2003 letters address disclosure permission; by November 17, UK and Italy reports could be shown at SEC offices alongside Japan's. The final index lists Italy, Japan, the UK and a March 8, 2002 Swiss report as **not produced but reviewed at SEC offices**.

SEC PDF 7,444–449,654,700–704 — RSEC 03010224 at 444/445; RSEC 03010722 at 449; RSEC 03011669 at 654. RSEC04021411 at 700 is a bookmark only.

Preserve the SEC/FBI no-evidence conclusion

The May 15, 2002 SEC memorandum says its review found no evidence of trading based on foreknowledge and explains unusual trading as consistent with legitimate strategies. It describes **over 9.5 million transactions, 103 companies, six industry groups, seven markets and 32 ETFs/indices**, generally August 20–September 11, 2001. Broad foreign requests generally used August 27–September 11. It documents DOJ/FBI coordination, referrals and information sharing. Where SEC could not determine overseas owners or interview decision-makers, it referred matters to the Financial Review Group and records its conclusion after those discussions.

The May 2004 follow-up records that the numerical corrections did not change the investigators' conclusion. Commission staff later supported that conclusion and separately described the U.S.-securities and foreign-securities scopes. This audit does not replace those findings with a volume or percentile inference, and does not claim to have independently replicated every trade or foreign disposition.

SEC PDF 2–7,11,21 — memo opening RSEC 03003652 at 2. Cella follow-up PDF 22 — MFR04019347 at 21. Commission monograph PDF 150,152–154; printed 147,149–151.

Scope limits remain explicit: the SEC says Treasury-market information came from FRBNY and that SEC did not itself review those trades. Futures inquiries and continuing control-list/early-warning work have separate scopes. The public packet does not contain complete native trade, allocation, price, cost or model inputs; P&L and statistical replication stop here. No redacted identities are guessed.

Supplementary sources and deliverables

The separately indexed 22-page Cella scan was retrieved from Cryptome: HTTP 200,1,480,444 bytes, SHA-256 `abb6103476a1d5968f4c216a073c8c075630411481ec5d2d4a33a1aa63dec0cd`. Its two visible identifiers are MFR03010885 and MFR04019347. No whole-file identity with an official NARA copy is established. The official 155-page Commission monograph was retrieved HTTP 200,537,715 bytes; its full hash/metadata and selected-page evidence are retained separately. Neither source contributes to the 704-page count.

The audit bundle contains the unchanged official PDF, complete JSON index, page/document CSVs, source-linked claim and foreign-referral JSON, this report, supplementary sources, 704 OCR texts, page evidence metadata, retrieval receipts and validation/reproduction tools. The prior R01 result was used only as a work map. No Deep Research, contacts, records requests, fees or changes to pending matters were used.
